

Flows in Salesforce

Automate your complex processes with Low-Code Visual Tool

Sheetal Chougule, Senior Technical Architect
@sheetalsfdc

Ground Rules

salesforce

Let's agree to some ground rules before we proceed

- Training will be delivered considering you do not know anything about Salesforce. So, even though you have prior experience keep your mind blank and open to learn more effectively.
- This is online live Training Session. Focus completely on session, even though recordings will be made available.
- Please make sure there is No background noise or disturbances.
- Questions will be addressed at the end of the session and will also setup a recurring meeting to discuss that week's question.
- **NO QUESTION IS SILLY.** So, you can ask same question again and again till you understand completely.
- **Phones on Silent.**
- **Complete all the assignments on time so you can understand next session.**
- **Do not forward invites unless you confirm with Trainer first.**

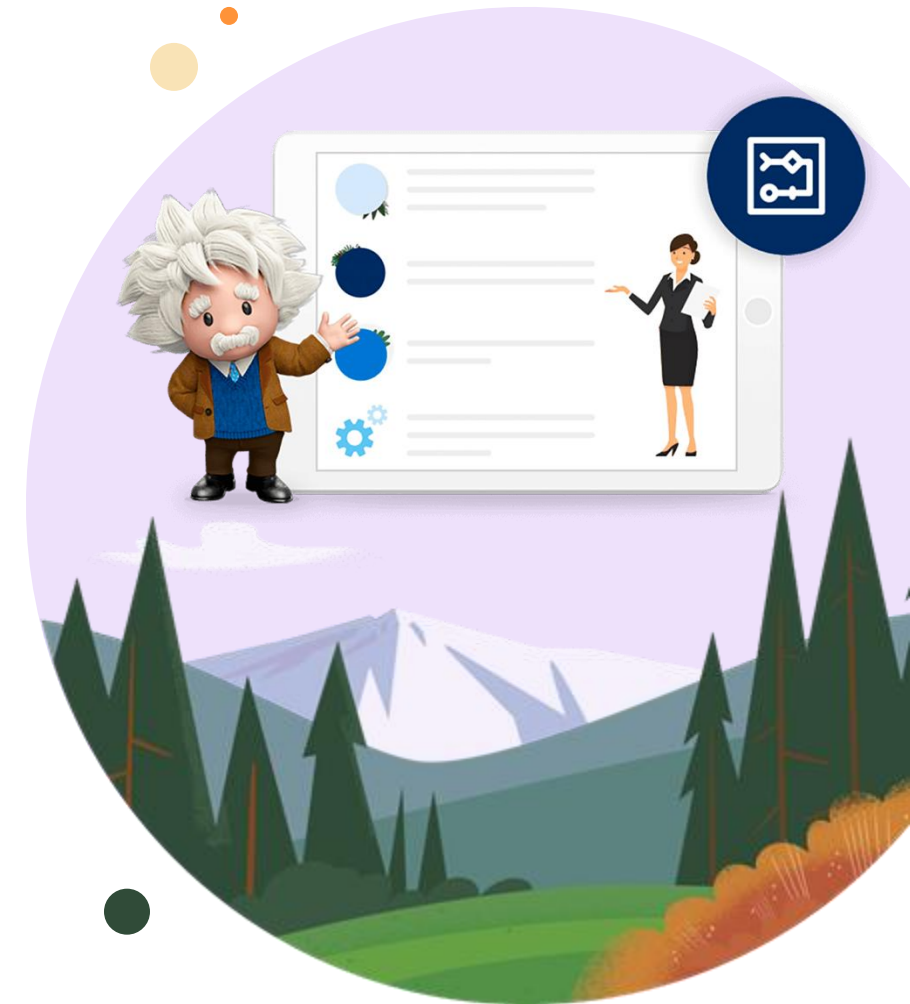

Keep it
Interactive

Salesforce Flows (Prior Lightning Flow/Visual Flow)

Declarative automation tool for business processes. Build complex workflows with ease and scalability

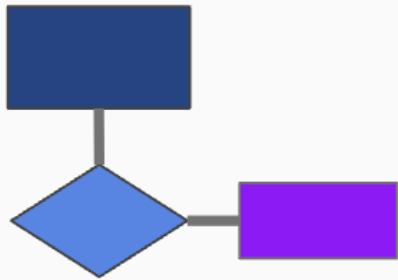

- It's low-code testing functionality allows admins and developers to build automated testing across their Flows without code.
- Flow enables to build workflows on the Salesforce Platform that automate across Slack, MuleSoft, and Tableau, connecting systems and business processes.
- Low-Code platform to automate your business processes and integrate at greater scale with faster speed and greater efficiency.
- Flows allows to gather data, process data and build complex business calculations proficiently.
- Can be launched from multiple platform features like record creation/updating/deletion, Home Pages, LWC and Custom components, other Flows and processes.
- In addition, **Flow Orchestration** uses automation to simplify multi-step and multi-user processes.
- Developers and Admins can now build more scalable automations by building reusable flow components.

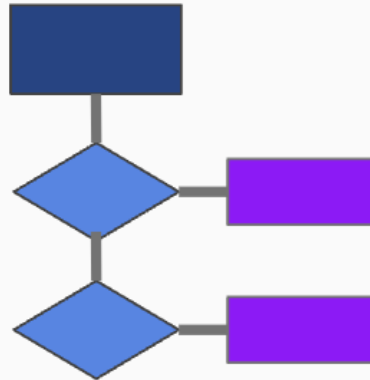

Click vs Code?

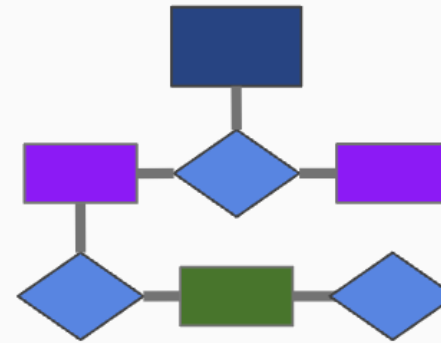

Tool selection is dependent on the business use case and there is no wrong solution. But there is always a better solution. Flows and Apex can handle most complex business automations.

Flow
(Launched by PB)

Apex

Workflow rules and Process builder will retire by Dec'25.

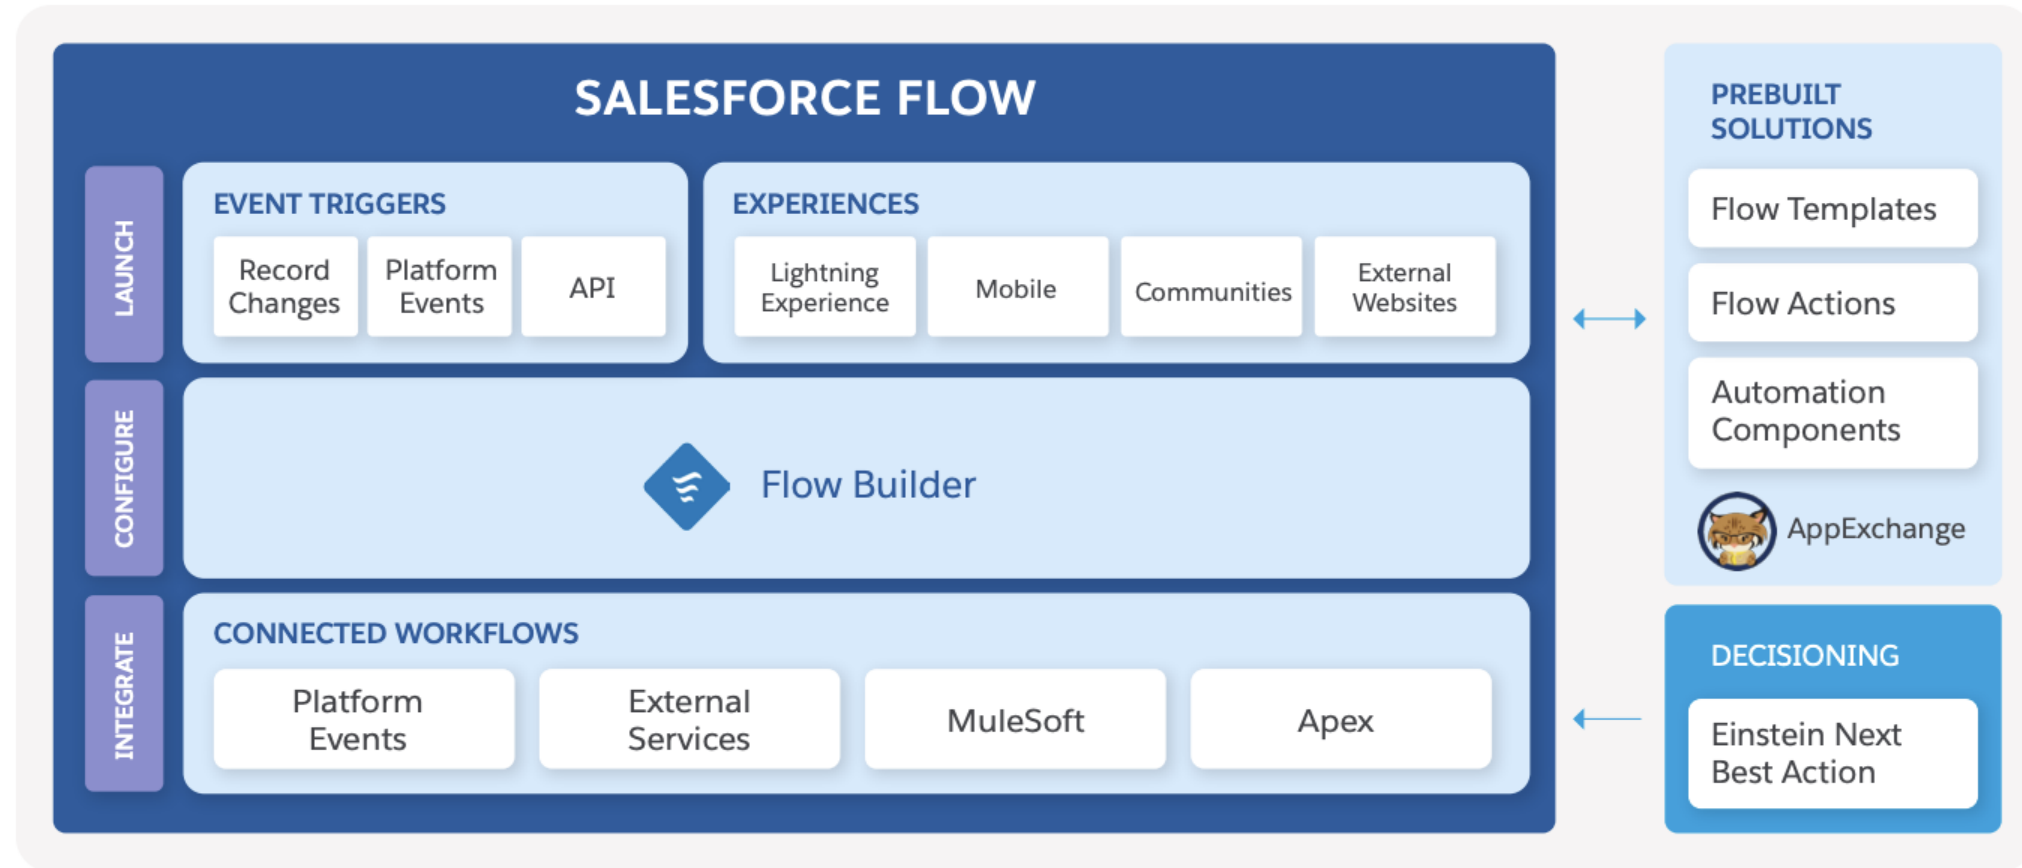

Extended Benefits of Flow

How Flow Works?

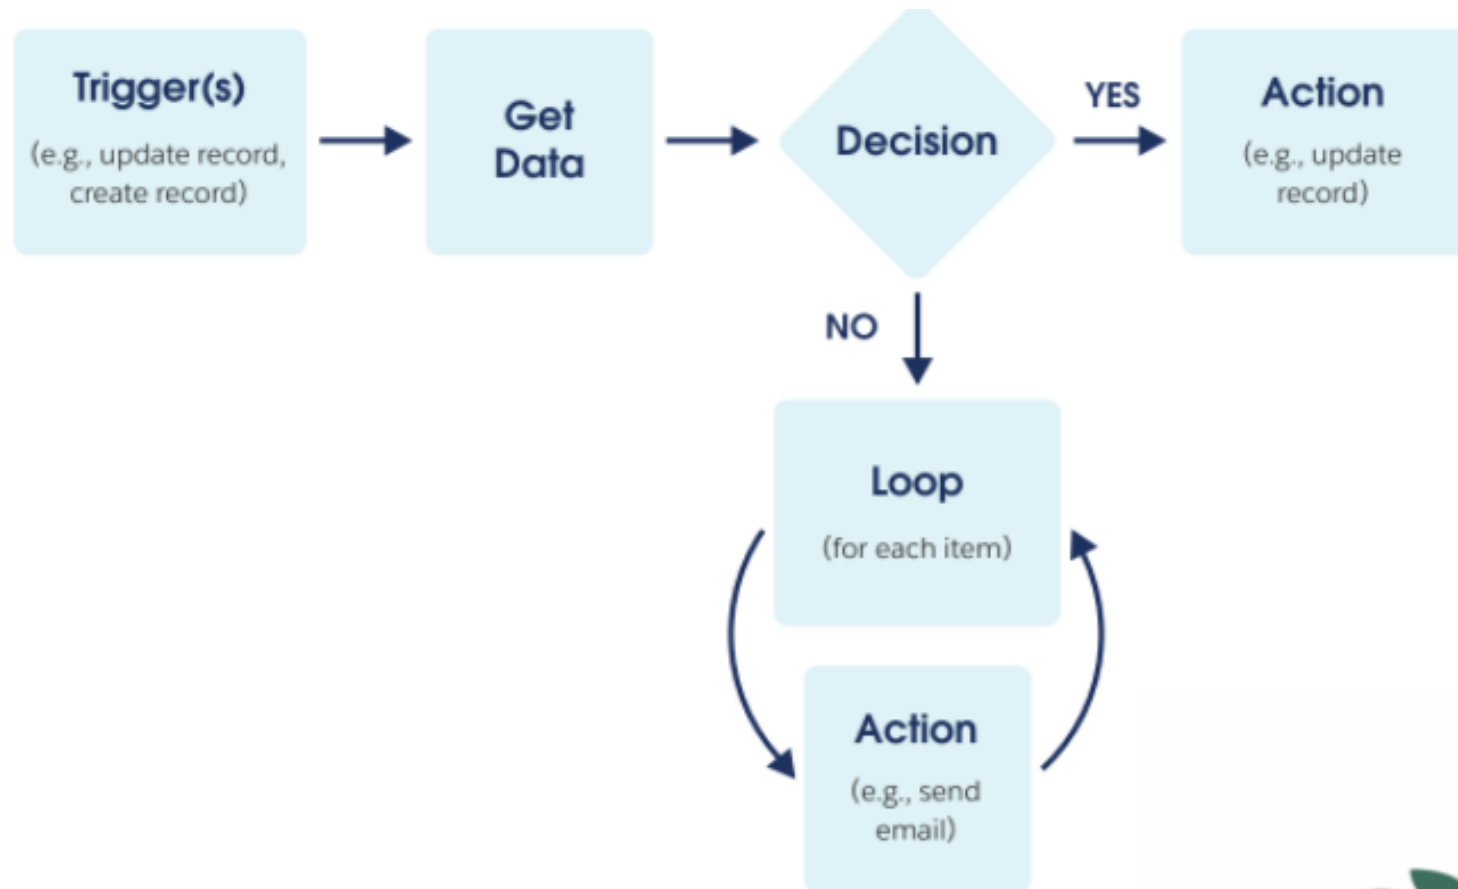

Flow makes it easy to define the right actions by modeling complex decision logic and looping through a number of records to take action, all without using code.

How Flow Works?

Flow makes it easy to define the right actions by modeling complex decision logic and looping through a number of records to take action, all without using code.

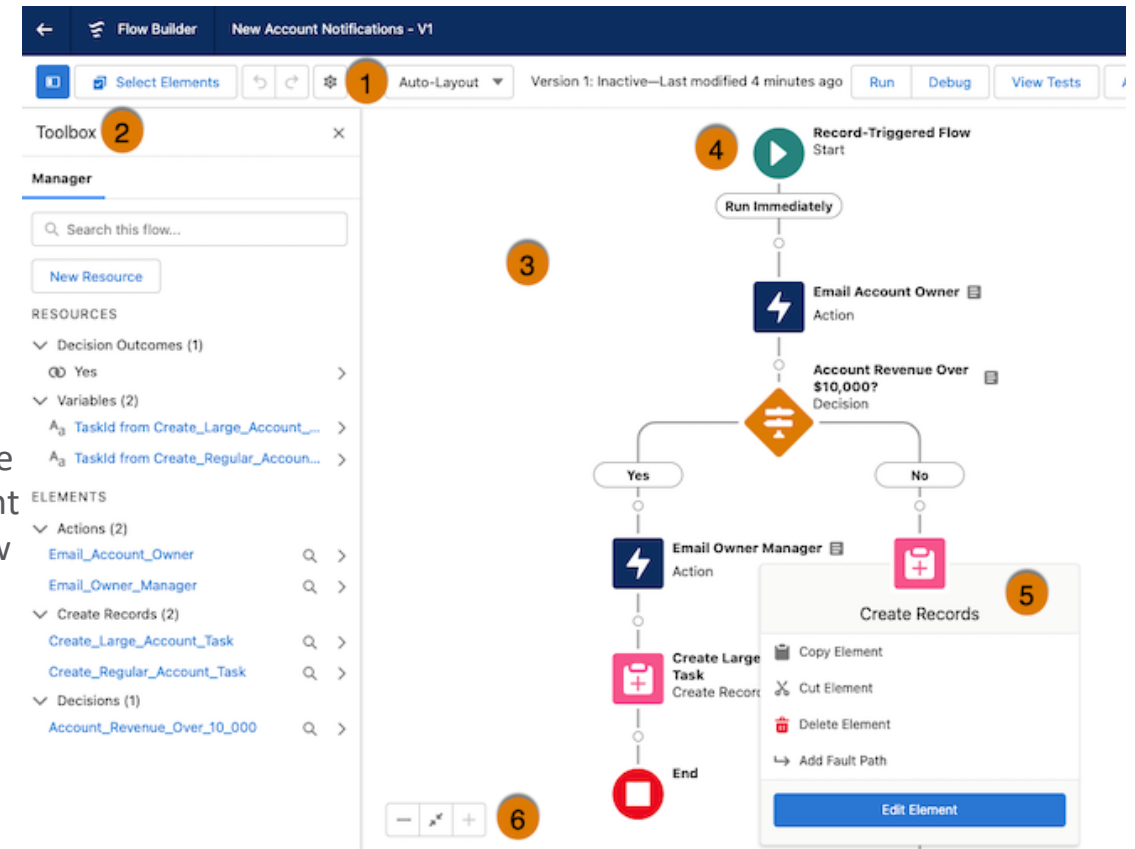

Flow Builder

Build flows using visual interface. User need “Manage Flow” permission to access flow builder.

- **Button Bar (1)** – Change the layout, run, debug flows, Test the flows, activate the flow.
- **Toolbox (2)** – Choose and create resources based on elements.
- **Canvas (3)** - working area where you build a Flow by adding Elements from the Toolbox. Add elements to the canvas and connect them together, you see a visual diagram of your Flow.
- **Start Elements (4)** – Starting node for the flow.
- **Elements (5)** – **Building blocks of the Flow.** Elements can be interactive, like a **screen** where users input information; logic-based, like a **decision** element that will alter the path your Flow follows; or **data-based**, like creating a new record.
- **Zoom Bar (6)** - zoom in and out of a flow.
- **Connectors** - are lines on the canvas that define the path the flow takes when it runs. They tell the flow which element to execute next.
- **Resources** - are containers that don't appear on the canvas, but are referenced by the flow's elements. Each resource contains a value or a formula that resolves to a value.

Key Components of Flow

Flow builder has some basic components – Toolbox, Elements, Canvas, Connectors and Resources

Elements

Represents action to execute
e.g reading or writing data,
retrieving information

Building blocks of the Flow

Types of Elements – Screen,
Decision, data
manipulation

Resources

Static or dynamic data that
needs to be referred by
the Flow

Represents and holds the
values

Connectors

Defines a path taken by the
flow

Use connectors like
Decision, Fault, Wait, Loop
Outgoing and Incoming go to
connectors

Types of Flow

Flows offer more actions to be automated for Admins and Developers. These actions help build more complex business processes easily.

1. **Screen Flow –**

- Capture information from user in single or multi-step form which are Invoked through User Interface rather than background processes.
- e.g: Insurance Details, Employee Information etc.

2. **Record-Triggered Flow –**

- execute a series of actions automatically when a record is created, updated, or deleted.
- can be executed either before or after the record is saved,
- before being used to make changes to the primary record,
- after being used to make changes to other records or trigger secondary actions like sending emails.

3. **Schedule-Triggered Flow**

- actions that should occur on a frequent schedule - once off, every day, or every week as required, and are run separately for each record in the batch.

Types of Flow

4. Platform Event-Triggered Flow

- Series of actions when a specified Platform Event Message is received.
- Flow will subscribe to a Platform Event, and will only execute the actions when a message is received.

5. Auto-launched Flow

- set of actions that fire triggered when invoked by other processes and automations outside of the original Flow
- For example, Apex, another Flow, Process Builder (historically – don't use Process Builder now), or by REST API.
- Help create reusable flows which can be invoked by other processes.

6. Record-Triggered Orchestration

- With Flow Orchestrator, a Record-Triggered Orchestration Flow type triggers off a multi-step, multi-user Flow Orchestration when a record is created or edited.
- Orchestration groups together multiple Flows that can be assigned to multiple users in succession, similar to how an approval process works.

Elements in Flow Toolbox

Elements Manager

Interaction (3)

Screen

Action

Subflow

Logic (4)

Assignment

Decision

Loop

Collection Sort

Data (5)

Create Records

Update Records

Get Records

Delete Records

Roll Back Records

Elements used to create user interaction – I/P or O/P and gather information from user. Or to perform action-based scenarios. Also invoke other flows.

Elements used to implement the business logic which determines what needs to be executed and when.

Elements used to perform DML operations in the Salesforce database. Or to retrieve the records from Salesforce instance.

What Can Start or Trigger a Flow?

FLOW STARTS OR TRIGGERS	FLOW TYPE TO USE	FOR EXAMPLE, YOU WANT SOMETHING TO HAPPEN...
When a record is created	Record-Triggered	When a new case is created.
When a record is updated	Record-Triggered	When a lead's status field is changed.
When a record is created or updated	Record-Triggered	When an account is created or the account priority field is changed.
When a record is deleted	Record-Triggered	When a contact is deleted.
After a certain amount of time	Record-Triggered	A week after a quote is created. Add a scheduled path to the record-triggered flow.
At a specified time and frequency	Schedule-Triggered	Every Saturday at midnight.
When a user clicks a button on a form	Screen	When a customer enters contact information into a flow screen and clicks the Next button.
When a user clicks a quick action button	Screen	When an employee clicks Request PTO on their employee record. Opens a form to complete.
When a user clicks a custom button or link	Autolaunched	When a user clicks a Complete Sale button after closing an opportunity. Starts background automations, such as updating records and emailing stakeholders.
When called by another flow	Autolaunched or Screen	When a flow executes another flow within the same running instance to reduce repetition within the main flow.
When called by Apex code	Autolaunched	When an Apex class is triggered by a change to an opportunity's stage, which triggers an autolaunched flow.
When a platform event message is received	Platform Event-Triggered	When an integrated printer is out of ink, it publishes a platform event message.

What Can a Flow Automate?

AUTOMATION	EXAMPLE
Create records	Create an account.
Update records	Change a contact's address.
Delete records	Delete a user's permission.
Send an email	Send an introductory email to a lead.
Collect input from external users with an online form	Let new customers add themselves to your contacts using an online form.
Collect input from internal users with a form placed on a Lightning page or launched by a button	Create an account, a contact, and a case quickly with one simple form placed directly on support reps' Home pages.
Send a custom notification	Notify managers when significant opportunities are won.
Send a survey	Send a customer satisfaction survey after an opportunity is closed.
Submit a record for approval	Require that managers approve discounts.
Run another flow in the context of the current flow	Run another flow that creates a contact within your account-creation flow.
Access external systems	Call actions registered by External Services to insert details from an external banking system into a Salesforce record.
Call a custom invocable action	Execute a custom Apex method that uses the InvocableMethod annotation. You decide what the action does.

When to choose which Flow

	Low Code	----->		Pro Code
	Before-Save Flow Trigger	After-Save Flow Trigger	After-Save Flow Trigger + Apex	Apex Triggers
Same-Record Field Updates	Available	Not Ideal	Not Ideal	Available
High-Performance Batch Processing	Available	Not Ideal	Not Ideal	Available
Cross-Object CRUD	Not Available	Available	Available	Available
Complex List Processing	Not Available	Not Available	Available	Available
Fire & Forget Asynchronous Processing	Not Available	Not Available	Available	Available
Other Asynchronous Processing	Not Available	Not Available	Not Available	Available
Custom Validation Errors	Not Available	Not Available	Not Available	Available

- **Available** = should work fine, with basic considerations.
- **Not Ideal** = possible, but with important and potentially limiting considerations.
- **Not Available** = no plans to support in any capacity in the next twelve months.

THANK Y☁U
